Attachments: TiPV Histopathology.pdf

If needed we could hold a meeting today before 4 PM and also involve the staff with disease experience

May be develop a plan for recording all the clinical signs and collect samples what is possible.

Mohan

Dear Mohan,

Attached paper describes histopathology of TiPV in the pancreas of tilapia broodstock. In this case we also observed a swollen gallbladder and necrotic ovary but not severe like the case you sent.

Best wishes,
Dong Ha

Dear Mohan

Thanks for your email. Senapin and I are doing well. I hope everything is well with you and your families.

I have never seen such severe signs like this before. The green liquid looks like bile color - perhaps something is wrong with the pancreas and liver's function.

If I have this case I will do following things

- 1) withdraw green liquid from the affected ovary using a sterile syringe for smear + Gram staining, and bacterial isolation (to access whether bacteria involve)
- 2) Isolate bacteria from multiple internal organ (to access whether bacteria involve)
- 3) Preserve samples for histology (liver, gut (anterior, mid and posterior), kidney, spleen, gills) - It is important to have pancreas (whitish) stick along the anterior and mid gut.
- 4) Preserve sample for PCR (ethanol 95%) (liver, gut (anterior, mid and posterior), kidney, spleen, gills)
- 5) Keep some freshly dead fish at -20 to -80 C for further recovery of virus (if diagnosed positive)

I have a feeling that Tilapia parvovirus (TiPV) may be involved in this chronic case. This virus usually targets the pancreas! (just an assumption we need to look into histopathology)

Please let us know if anything we can assist.

Best wishes,
Dong Ha

Good morning Dong Ha and Senapin

Hope both of you are doing great

Can you please take a quick look at these tilapia pics and provide your comments. Fish are bloated like dropsy and when you cut open you see this.

After hearing from you, we could plan to collect some samples

Kind regards

Mohan
